A livello mondiale

Il Cancro Gastrico 5° causa piu` frequente di malattia neoplastica

3° causa piu`frequente di mortalita`fra le malattie neoplastiche

Causa principale del Cancro Gastrico l`infezione da Helicobacter pylori

Epidemiologia del carcinoma gastrico

Incidenza

Nel 2023, sono state stimate circa
15 000 nuove diagnosi
(uomini = 9000; donne = 6000)

Mortalità

Nel 2022, sono stimati 9.900 decessi
(uomini = 5700; donne = 4200).
Le stime per il 2023 non sono disponibili

Sopravvivenza netta a 5 anni dalla diagnosi

30% negli uomini e 35% nelle donne

Probabilità di vivere ulteriori 4 anni condizionata ad aver superato il primo anno dopo la diagnosi

53% negli uomini e 59% nelle donne

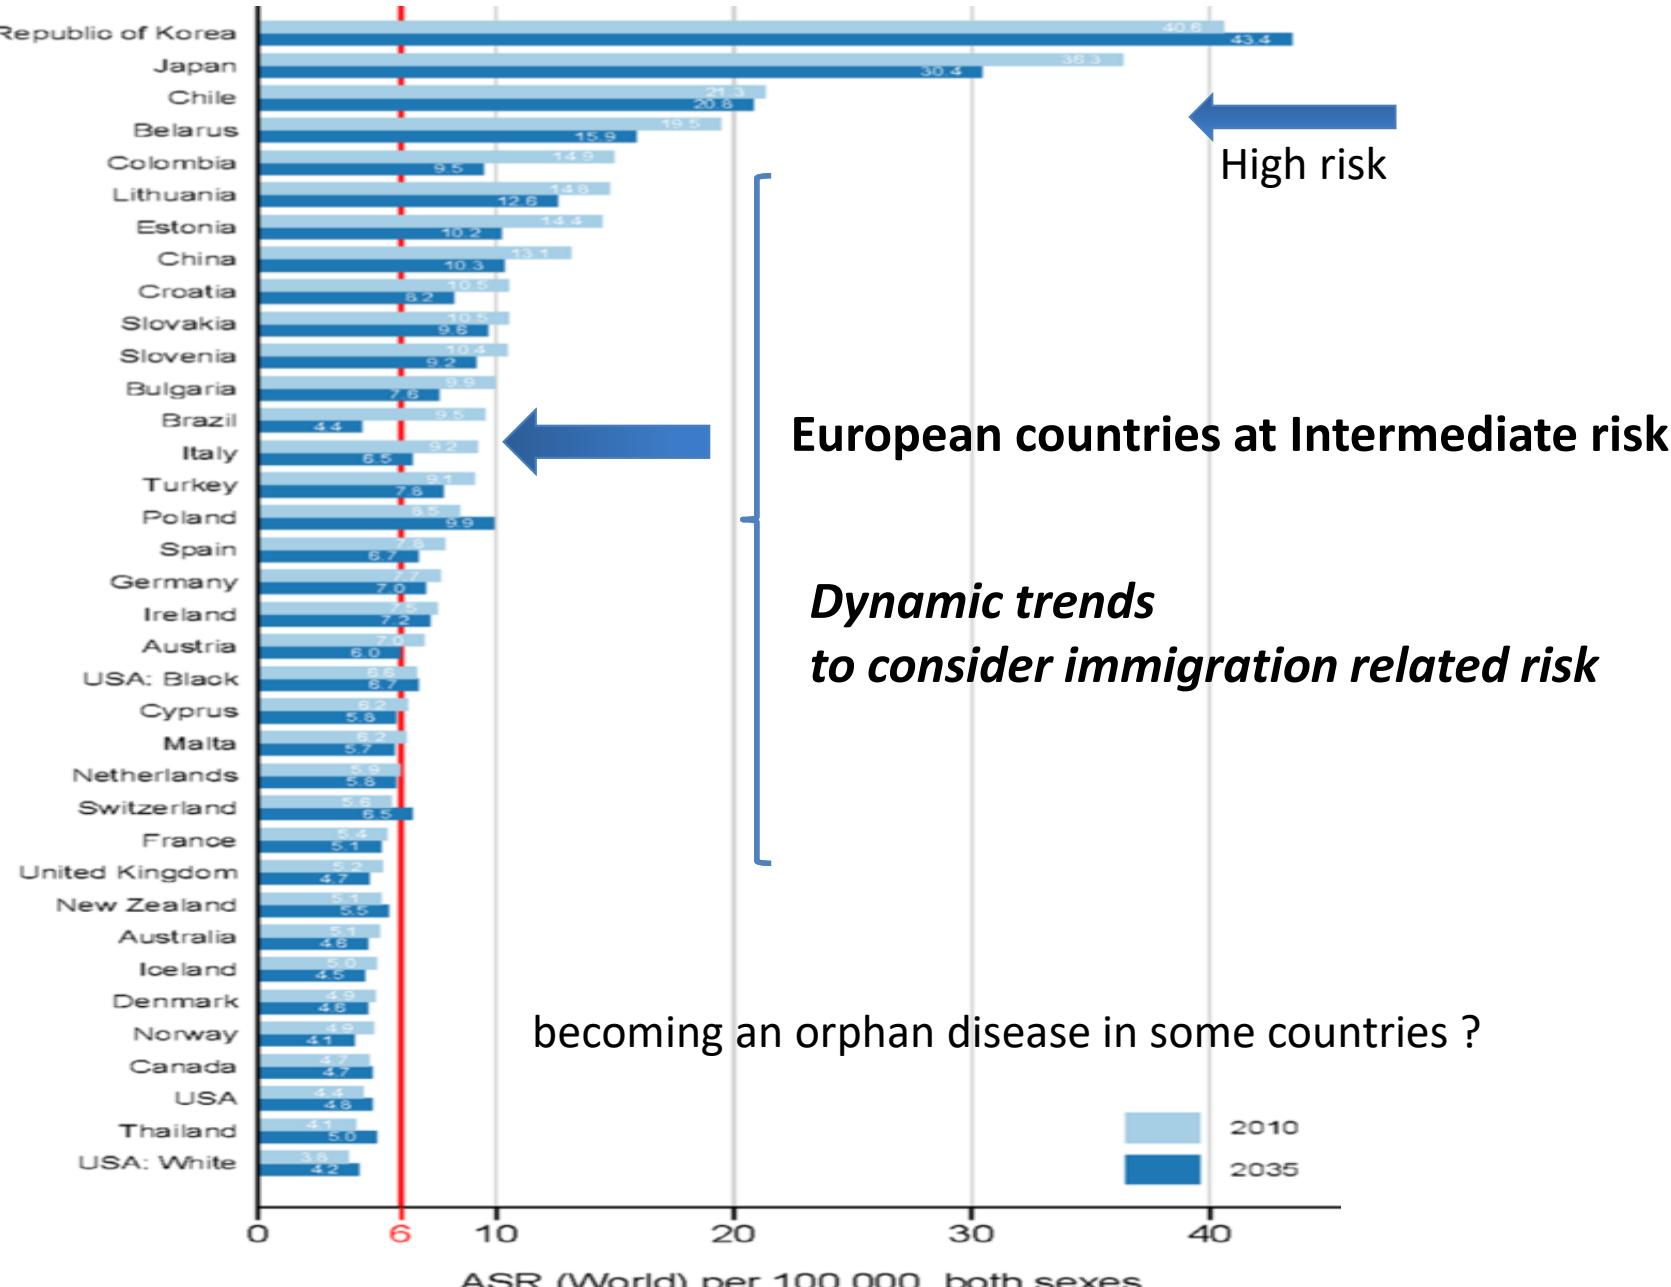

Prevalenza

82400 le persone viventi in Italia dopo una diagnosi di tumore dello stomaco (uomini = 50300; donne = 32100)

Il 90% dell` adenocarcinoma gastrico è causato da *H.pylori*

A global assessment of predicted incidence trends to 2035.

The Rationale H.pylori test & and treat for gastric cancer prevention

The stepwise progression
in gastric carcinogenesis
offers opportunities for intervention

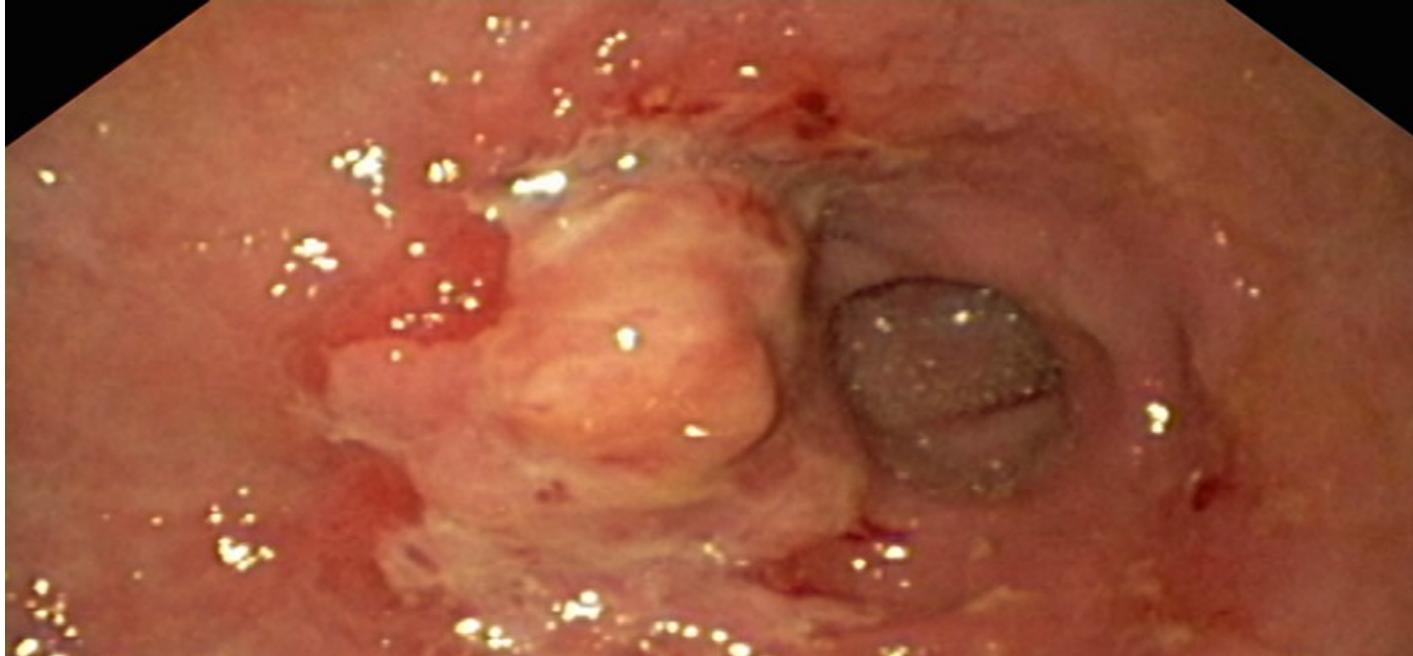

H.pylori Gastritis and the „Correa“ cascade towards gastric cancer

- H.pylori virulence factors
- Host genetics
- Environment
- Lifestyle

Gastric cancer prevention!

The mission

Gastric cancer burden will continue to increase for the next decades because of the demographic development

***H. Pylori infection* is carcinogenic to humans and responsible for 90 % of gastric cancer cases worldwide**

Screen and Treat

Option endoscopy

Option „non-invasive“

Come arrivare alla diagnosi dell`Infezione da H.pylori ?

Il metodo diagnostico deve essere scelto in base a criteri rilevati dall `anamnesi in paziente/individuo

Diagnosi H.pylori

Invasive tests

Gastroscopic biopsies from antrum and/or corpus with or without angulus

Formalin-embedded
tissue samples

Histology for gastritis grading and staging

Direct detection via PCR, qPCR or FISH

AST via NGS

Fresh tissue samples

Rapid urease test

Microbial culture

AST using different antimicrobials

AST via NGS or RT-PCR

Malfertheiner et al Helicobacter pylori infection.

***Helicobacter pylori* Treatment for Gastric Cancer Prevention**

Peter Malfertheiner, M.D.

Gastric cancer has become a potentially preventable disease through eradication of *Helicobacter pylori*. However, issues that are associated with “screen and treat” strategies — their effectiveness, proper selection of populations, and cost-benefit considerations — interfere with the application of such programs in regular practice.

A major uncertainty relates to the appropriate timing for the implementation of a screen and treat program. One factor influencing this uncertainty is whether *H. pylori* eradication is effective at stopping the carcinogenic process in patients with severe chronic atrophic gastritis, an advanced precursor lesion to gastric cancer.¹

In this issue of the *Journal*, Choi et al.² report the results of their randomized, placebo-controlled trial, in which at a median follow-up of 5.9 years, *H. pylori* eradication was effective in the prevention of gastric cancer.

Health systems is high, and the disease is difficult to treat because diagnosis is usually made in an advanced stage. The clinical course is characterized by a high symptom burden and an

**should be encouraged in combination
with screening for colorectal cancer in
patients older than 50 years of age in Western
societies (low or intermediate risk of gastric cancer.)**

that are aimed at the detection of gastric cancer at an early and more curable stage have led to a significant reduction in mortality from the disease.⁴

The most relevant new target in gastric cancer prevention is *H. pylori* infection. Unequivocal evidence from epidemiologic, basic, and clinical research has identified *H. pylori* as a primary fac-

Towards gastric cancer elimination

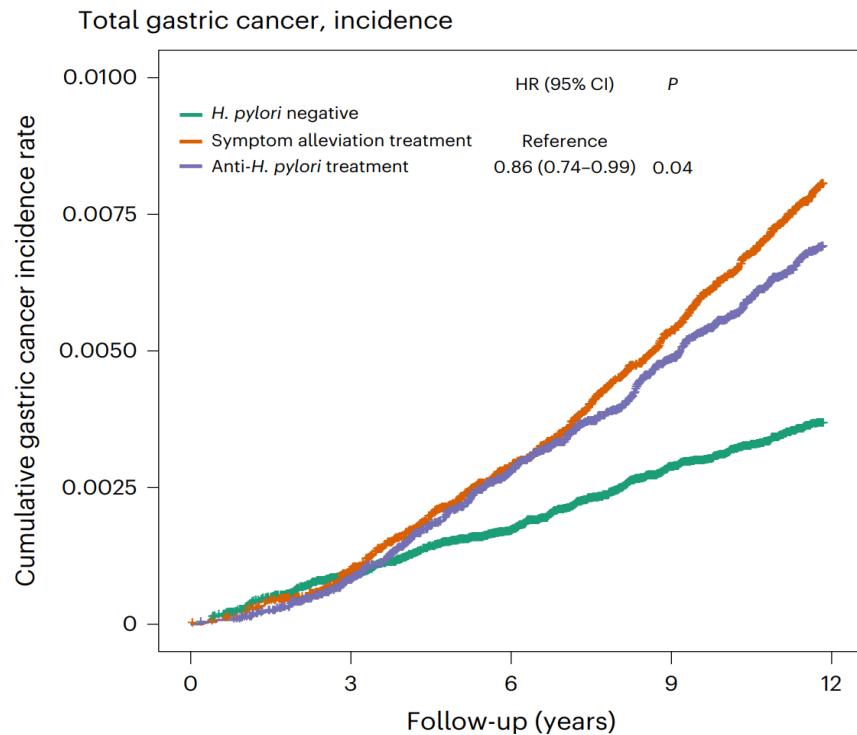

Mass eradication of *Helicobacter pylori* to reduce gastric cancer incidence and mortality: a long-term cohort study on Matsu Islands

- 6 rounds of population-based screen and treat programs (2004-2018)
- HP prevalence 64% down to 15%
- Reinfection rate <1% per person-year
- atrophic gastritis and intestinal metaplasia decreased over time
- **53% reduction in gastric cancer incidence compared with the historical control period of 1995-2003**
- No significant changes in antibiotic resistance rate

Gastric cancer prevention by community eradication of *Helicobacter pylori*: a cluster-randomized controlled trial

Pan KF, et al Nat Med. 2024 Jul 30. doi: 10.1038/s41591-024-03153-w. Epub ahead of print. PMID: 39079993.

The cluster-randomized, controlled MITS trial based on participants aged 25–54 years confirmed that *H. pylori* treatment reduced gastric cancer risk, albeit modestly.

Supports implementation of mass *H. pylori* screening and treatment from early adulthood as a public health policy and clinical practice for gastric cancer prevention in high-risk communities

Esempio Giappone

- Since 2013, the Ministry of Health, Labour and Welfare approved the expansion of National Health Insurance coverage for *H. pylori* eradication treatment in patients with chronic gastritis.
- Between 2013 and 2019, 8.5 million patients diagnosed with chronic gastritis were treated with *H. pylori* eradication
- *H. pylori* screening resulted in significant cost savings and health impacts for GC prevention

A. Kowada and M. Asaka, "Economic and Health Impacts of Introducing *Helicobacter pylori* Eradication Strategy Into National Gastric Cancer Policy in Japan: A Cost-Effectiveness Analysis," *Helicobacter* 26, no. 5 (2021): e12837

15 057 participants (8852 indigenous and 6205 non-indigenous)

- participation rate of 80.0% (15 057 of 18 821 invitees).
- H.pylori positive 44.1% (95% CI 43.3% to 44.9%).

proof-of-concept study with 72 indigenous families (258 participants),
family members of a positive index case had 1.98 times (95% CI 1.03 to 3.80) higher Hp prevalence than those of a negative index case.

Gut 2023;72:2231–2240.
doi:10.1136/gutjnl-2023-329871

- 6643 testing positive,
- 5493 (82.6%) received treatment
- eradication rates
ITT 91.7% (89.1% to 94.3%)
92.1% (89.2% to 95.0%),

adverse effects leading to treatment discontinuation was low at 1.2% (0.9% to 1.5%).

Test & Treat Cost- effectiveness (example Spain)

Endpoint: Gastric cancer

	Costs	Probability of Gastric Cancer	Cost per Gastric Cancer avoided
Test Treat	522.91	0.0022	524.07
Endoscopy	713.95	0.0026	715.79
Symptomatic treatment	693.41	0.0031	695.55
UBT Test and Treat	417.41	0.002	418.26

Costs to be spent each year to prevent 1 potential gastric cancer which might appear over 10 years time-horizon

**Test & Treat strategy
as “opportunistic” gastric cancer prevention**

Beresniak A, et al

Helicobacter. 2020;e12693. doi:10.1111/hel.12693

Europe's Beating Cancer Plan

- The Cancer Plan aims to tackle the entire disease pathway
- Four pillars: (1) prevention; (2) early detection; (3) diagnosis and treatment; and (4) quality of life of cancer patients and survivors
- Gastric cancer: (1) Preventing cancers caused by infections
Furthermore, the Commission will help ensure access to vaccination against Hepatitis B and to treatments to prevent liver and gastric cancers associated with the Hepatitis C virus and Helicobacter pylori infections

(2) Improving early detection of cancer

available scientific evidence. Extending targeted cancer screening beyond breast, colorectal and cervical cancer to include additional cancers, such as prostate, lung and gastric cancer, will be considered.

Improving cancer screening in the European Union

- SAPEA (Science Advice for Policy by European Academies) recommendations
- Well-designed screen and treat strategies for reducing *H. pylori* infection provide a key opportunity to prevent gastric cancer in EU member countries with intermediate to high incidence of the disease and could be considered on a regional or national basis alongside

Conclusion: Gastric cancer screening

While there is insufficient evidence to recommend endoscopic screening of gastric cancer in Europe, the screen and treat strategy for reducing *H. pylori* infection provides an opportunity to prevent gastric cancer in EU member countries with intermediate to high gastric cancer incidence.

TOWARDS GASTRIC CANCER SCREENING
IMPLEMENTATION IN THE EUROPEAN UNION

Coordinator M. Leja

Under the guidance of Prof Marcis Leja, more than 20 partners are working on the TOGAS project to aid policymakers in incorporating gastric cancer screening into healthcare priorities while balancing its effectiveness, feasibility and acceptability with long-term potential adverse effects. Along with Prof Leja, the project team includes researchers from Latvia, Slovenia, France, The Netherlands, Belgium, Portugal, Spain, Lithuania, Romania, Austria, Poland, Croatia, Ireland and Germany. The project will be running for three years, and is funded with over 9 million euros.

- evaluation of effectiveness of various strategies for prevention of gastric cancer mortality in EU countries with various burden of gastric cancer and prevalence of H.pylori
- screen and treat strategy extended to 6 000 young individuals (aged 30-35 years) in 7 centres of 6 countries (Croatia, Ireland, Latvia, Poland, Romania and Slovenia)
- investigate the presence of stomach precancerous lesions in individuals aged >50 years undergoing colonoscopy within colorectal cancer screening program.

Several options and modalities

Screening and eradication of *Helicobacter pylori* for gastric cancer prevention: the Taipei global consensus.

Liou JM, Malfertheiner P, Lee YC et al

Gut. 2020 Oct 1:gutjnl-2020-322368. doi: 10.1136/gutjnl-2020-322368. Epub ahead of print. PMID: 33004546.

- Evidence supports the proposal that eradication therapy should be offered **to all individuals infected with *H. pylori***
- Vulnerable subjects should be tested, and treated if the test is positive
- Mass screening and eradication of *H. pylori* should be considered in populations at higher risk of GC

Take Home Message

- Gastrite da H.pylori è una malattia infettiva
- responsabile del 90% dei casi con cancro gastrico
- *H.pylori* gastrite rappresenta il **rischio principale** per ulcera peptica e **cancro gastrico**
- **Test & Treat** e` raccomandato in soggetti sintomatici
- **Screen & Treat** e` raccomandato in soggetti asintomatici con **rischio maggiorato per carcinoma gastrico**
“ strategies tailored to country specifics”
-

Test non-invasivi (eg 13 C-UBT) sono idonei in strategie di prevenzione del cancro gastrico
